

1 **ABSTRACT OF THE DISCLOSURE**

2 A stirring device for an electrical discharge machine includes an air output
3 device adapted to be immersed in the tank, a high pressure tank adapted to be in
4 communication with the tank by a connection tube and a unidirectional valve in
5 communication with the high pressure tank and the tank to control whether air in the
6 high pressure tank flows to the air output device to stir the processing liquid and the
7 processing particle in the tank or the electrical discharge machine.
